

Consultancy

Consultancy

As an IT services company we are keen for our customers to make the best use of computing technology to help their businesses grow.

We discuss with our customers what they wish to achieve through the use of IT and any concerns they have on any aspect of its implementation or application. We then put together a solution tailored to the needs of each customer, which is explained in a jargon-free manner.

This tailored solution is aimed at providing our customers with:

- Problem - free computing.
- A best-fit solution that doesn't break the bank.

At Ondev we can advise you on the best use of IT to help you achieve your business goals.

For example, installing a computer network can improve efficiency and productivity through:

- The ability to share printers and other peripheral devices means expenditure on such devices can be reduced.
- Staff being able to deal with more customers/clients at the same time by accessing centrally held customer databases.
- Key company information held and maintained on a central server means all staff can access and share one up-to-date version.
- Staff can share a single internet or broadband connection, and thus all have access to email

we

If you have five or more computers in your business you would benefit from a computer network. we we
